Claim 2; Page 4; 5pp; German.
Claim 2; Page 4; 5pp; German.
The DNA may be used as a hybridisation probe for detecting the HLA B27 gene, e.g. for assessing susceptibility to rheumatic disorders storn as spondylatis, or may be used to transform cells for prodn. of HLA B27. The HLA B27 may be used to detect HLA B27 antibody in human serum, or to produce mono- or polyclonal HLA B27
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       03-APR-1991 (first entry)

DNA coding for human histocompatibility antigen HLA-B 27 - useful for diagnosis and antigen and antibody prodn.

for diagnosis and antigen and antibody prodn.

for diagnosis and antigen and antibody prodn.

THE DNA may be used to detect the HLA-B 27 gene (opt. mutated) in human genetic material. The HLA-B 27 may be used to detect anti-HLA-B 27 antibodies in human serum. The antibodies may be used to determine HLA-B 27 lavels in human serum, e.g. for diagnosis of rheumatic disorders, esp. ankylosing spondylitis.

Detecting pre-disposition to seronegative spondylarthropathies from the absence of a C residue at a specific position in the 3'-flanking region of the HLA B27 allele

Claim 1; Page 52-56; 68pp; Bng1ish.

Claim 1; Page 52-56; 68pp; Bng1ish.

Genetic predisposition to seronegative spondyloarthropathies (SNSA) is detectied by determining the absence of a cytosine nucleotide in the 3' flanking region (see also T61647-48) of an HLA-B27 consensus consition corresponding to nucleotide 4495 of the HLA-B27 consensus sequence given in T61639. Probes and primers (see also T61640-46) based on this region can be used in diagnostic assays to detect the genetic predisposition to SNSA, and permit the distinction of B27+ individuals who are resistant to SNSA from B27+ normal individuals who are resolutible (but as yet unaffected) to such diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Transgenic non-human mammalian HLA-Bw 52 gene - useful for analysis of expression of gene structure, and prodn. of mouse model of human disease bisclosure; Fig 1; Bpp; Japanese.

Disclosure; Fig 1; Bpp; Japanese.

The sequence shows the exon 2 alpha-1-domain of the human leukocyte antigen-Bw 52 gene. The complete gene may be introduced into non-human mammals, pref. rat or mouse, or their ancestors at the primary developmental biological step via transplantation into the zygote or embry to generate transgenic non-human mammals incorporating the HLA-Bw 52 gene in both their germ cells and somatic cells. Transgenic non-human mammals contg. HLA-Bw 52 are useful for the analysis of expression of the gene, its structure, and prodn. of mouse models of human also also not the gene, its cructure, and prodn. of mouse models of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  09-WAR-1993 (first entry)

Allotype specific monoclonal anti- HLA antibodies prodn. - using hybridomas derived from transgenic animals carrying HLA gene and immunised with HLA antigen of different allotype bisclosure; Fig 1 A-G; 20pp; English.

The human HLA-B51 gene was injected into fertilised mouse eggs and then these introduced into the uterus of a pseudo pregnant mouse. The young were tested to ensure incorporation of the gene into the chromosome, and one of them mated 3 times with a normal male to produce 16 young, seven of which carried the HLA-B51 gene.

The transgeneic offspring were immunised with HLA antigen.
                                                                                                                                                                                                                                                                    03-JAN-1991 (first entry)

HLA-B51 gene for production of monoclonal antibodies.

Alloptype specific monoclonal anti-HLA antibodies; hybridomas; transgenic animals; HLA-B51 gene; ss.

New DNA for class I human leucocyte antigens and derived probes and transformed cells, useful for DNA typing, as immunogens etc.
Claim 2; pp11-12; 23pp; English.
The HLA class I DNA can be used a source of probes for use in DNA typing. Transformed cells, which are useful as immunogens, can be obtained by introducing these DNAs into eucaryotic cells.
Sequence 1086 BP; 223 A; 335 C; 358 G; 170 T;
                                                                                                                                                                                                                                                                                                  The DNA for class I human leucocyte antigens and derived probes and transformed cells, useful for DNA typing, as immunogens etc. Claim 1; Page 11; 23pp; English.

The HLA class I DNA can be used a source of probes for use in DNA typing. Transformed cells, which are useful as immunogens, can be obtained by introducing these DNA into eucaryotic cells. Sequence 1086 BP; 224 A; 334 C; 356 G; 172 T;

Human nucleic acid fragments, isolated from brain adrenal tissue, the placenta or bone marrow comprise any of: (A) a sequence selected from (076401-077613), (B) an allelic variation of a sequence as described in (A), or (C) a sequence complementary to (A) or (B).
                                                                                                                                                                                                                               HIA-Bw53 exon.

Outer membrane protein of Haemophilus influenzae type B - used as vectine against infections, esp. in infants and for diagnosis Disclosure; Fig 5: 33pp; English.
Plasmid pRSM793 contains only the 3' portion of the Pl gene. The plasmid pRSM793 contains only the 3' portion of the Pl gene. The sequence. The cro-lac2-omppl lusion protein produced from pRSM793 was recognised by rabbit and guinea pig Pl-specific antisera in
Preferred sequences exhibit no more than 90% homology to a human sequence known per se. Sequence 213 BP; 76 A; 39 C; 41 G; 57 T:

New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. neurological disorders, tumnus disorders, inflammation or haematological disorders tumnus, immune disorders, inflammation or haematological disorders Claim 1: Page 170: 215pp; English.

X51701-55 encode human secreted proteins. The polynucleotides and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Pathological conditions can also be diagnosed by determining the presence of mutations in the new polynucleotides. Specific uses are presence of mutations in the new polynucleotides. Specific uses are described for each polynucleotide, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, immune disorders, infection, inflammatory disorders, skin disorders, tumours, atherosclerosis, restenosis, autoimmune disorders, landucines, activation in europathics, tramma, spinal cord injuries, allergy, hematopoietic disorders, asthma, immunodeficiency disorders, neurological disorders, asthma, immunodeficiency disorders, and transplant references.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               02-APR-1997 (first entry)

Claim 47; Page 80-81; 216pp; English.

Claim 47; Page 80-81; 216pp; English in the mode of the invention for the detection of Hillumana in a sample. The method comprises using probes and/or amplification primers which are specific, ubiquitous and sensitive for determining the presence and/or amount of nucleic acids from selected bacterial species in any sample, where the bacterial nucleic acid comprises a selected target region hybridisable with the probes or primers. The method comprises contacting the sample with the probes or primers and detecting the sample with the probes or primers. The method comprises as and indication of the presence and/or amount of hybridised primers or amplification products as and indication of the presence and/or amount of the bacterial precentage of secarcial pathogens, e.g. Escherichia coli, Klebsiella pneumoniae, Steuphylococcus areus, Staphylococcus spidermidis, Enterococcus progenes, themophilus influenzae and Moraxella catarrhalis. These bacterial and species are associated with approx. 90% of uninary tract infections and septical meningitis, pneumonia, intra-abdeminal infections and septical meningitis, pneumonia, intra-abdeminal infections signification of the presence infections including and proved and processed the meningitis, pneumonia, intra-abdeminal infections and septical meningitis, septicance and meningitis, septicance and meningitis, septicance and meningitis, septicance and menin

Tarti-S. aureaus vaccines

Claim 1; Page 1047-1049; 3271pp; English.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences
of the invention. The DNA sequences are recorded on a computer readable
of the invention. The DNA sequences are recorded on a computer readable
medium, preferably selected from a floppy or hard disk, random access
memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using
that protein-encoding or regulatory regions of commercial, therapeutic or
industrial importance can be obtained. Specifically, sequences which are
inkely to encode antigens have been identified and these polypeptides can
be used in a vaccine composition against S.aureus infection. The
collypeptides can also be used in a kit for the immunodatection of
S.aureus in a sample. S.aureus is implicated in numerous human diseases,
including cellulitis, eyelid infections, food poisoning, osteomyelitis,
skin and surgical wound infections, scalded skin syndrome, toxic shock
syndrome, etc. Organisms transforamed with the DNA sequences can be used
for recombinant production of the polypeptides. The new DNA sequences
can their fragments) are useful as primers or probes for isolating
computer readable medium.
/*tag= a /note= "these bases represent a line of missing text in the sequence listing in the specification. They are included to maintain the nucleotide numbering given in the specification for this DNA sequence"
